

Your calendar, turned into a personal soundtrack.

Sounday reads your week, infers the emotional demand of each event, and generates a track timed and themed to it — **calm when you're overloaded, confidence-priming before the big meetings** — then measures the before → after mood shift to learn what actually works for you.

1 · Target user

Beachhead: high-stakes, calendar-driven knowledge workers who switch between emotionally demanding meetings all day.

- **Founders and client-facing salespeople / AEs first**, then execs, consultants, lawyers, investors.
- **Why them:** their performance is gated by *state* — calm under pressure, confident in the room. The cost of a bad state is huge and measurable ("win the pitch / close the deal"), they live inside their calendar, and they already self-medicate with hype playlists before big moments.
- **Expansion:** any calendar-driven professional → then **teams** (sales orgs, exec coaching, leadership) as a performance + wellbeing benefit.

2 · Best business model

- **Now — prosumer freemium (B2C):** free demo week + waitlist; **Pro ~£8–12/mo** unlocks unlimited generation, calendar sync, push reminders, and taste personalization.
- **Where the money is — B2B2C:** land with individual founders/AEs, expand to **per-seat team plans** sold to companies as a performance + wellbeing benefit. Bottom-up like Slack/Notion.
- **Later (optional upside):** an embedded "soundtrack for your calendar" API inside calendar/PM tools, and a privacy-safe, aggregated mood → performance insight layer. Lead with subscription; these are upside, not the core bet.

3 · The gap in the market — the \$10T workplace productivity gap

- Gallup pegs disengagement + lost productivity at **~\$8.8–10T globally per year**. Stress and constant context-switching are core drivers.
- Every existing tool optimizes the **calendar** (scheduling/time-blocking: Motion, Reclaim, Clockwise) or the **tasks** (PM/todo apps). **Nothing manages the emotional state you bring into each meeting.**
- Performance is gated by state — yet there is no tool that **proactively regulates state, timed to your real day**.
- Music is a clinically-backed, zero-friction state regulator (tempo/energy drive arousal and mood). But Spotify/Apple are generic and passive — disconnected from what you're about to walk into. **That's the gap we own.**

4 · How we're different from competitors

Competitor	What they do	Why Sounday is different
Spotify / Apple Music	Generic playlists <i>you</i> pick	Calendar-aware and proactive — reads your schedule, infers each block's emotional demand, generates a bespoke track timed and themed to that meeting (even naming the company/purpose in the lyrics), pinged to your phone right when you need it
Endel / Brain.fm	Focus soundscapes, single ambient mode	Spans the full range — calm-you-down ↔ prime-you-up — keyed to specific events, not one mode
Calm / Headspace	Meditation you stop and opt into	In-flow , embedded in the workday, and measures the before → after mood shift to prove it moved your state
Reclaim / Motion / Clockwise	Optimize <i>where</i> things go in your calendar	We optimize <i>how you show up</i> to them — complementary, not competing

Our moat: the before/after mood data becomes a feedback loop that learns which acoustic recipes reliably shift *you* from tense → ready. That personalized state-regulation engine + dataset is the defensible part — and it's already built.
